Clever currency hedging for Swiss investors: Tenor tactics for lower carry costs

January 17, 2024 | By Mesirow Currency Management

While passive hedging can effectively lower currency risk in international portfolios, the negative interest differential between Switzerland and the United States has hurt Swiss investors as US investments typically dominate foreign allocations. This has led to a need for innovative strategies within hedging to alleviate carry penalties while managing currency risk. One such approach, where Mesirow has excelled, is tenor management.

Currency risk in international portfolios

With Switzerland allocating most of their equity and bond investments overseas, currency risk continues to be a major source of risk for pension plans. Currency overlay managers such as Mesirow have the expertise to manage this risk for Swiss investors. For risk averse investors, passive hedging offers a solution that effectively reduces currency risk in the international portfolio.

Challenges with passive hedging for Swiss Investors

Due to the negative interest differential between Switzerland and the US, passive currency hedging inflicts a carry penalty for Swiss investors hedging US dollar. With the current rates of Switzerland and the US at 1.75% and 5.5% respectively (as of this article's publication, January 2024), the carry penalty associated with hedging the US dollar is not insignificant. Therefore, while passive hedging is a solution that reduces currency risk, the cost associated with hedging remains a burden.

Tenor management for enhanced returns and risk control

While maintaining the prescribed level of currency risk in the portfolio remains the priority, the structure of hedging allows for choice of forward contract length, i.e., tenor selection. Fixed interval value dates are often used to simplify operational complexities, e.g., fixed 3M contracts result in settlements and cash flows on a fixed quarterly interval. For investors who have high cash flow and liquidity sensitivities, staggering multiple contracts can help reduce cash flow volatility while maintaining the same fixed payout interval, e.g., 2 fixed 6M contracts each covering 50% of the exposure, staggered 3 months apart. For investors who prioritize a return boost over operational complexities, while maintaining the desired level of currency risk, selecting optimal tenors through tenor management can achieve this goal.

To illustrate this opportunity through tenor selection, durations from 1 week through 1 year are displayed in the following charts, revealing that carry penalties vary over time. For Swiss investors, higher negative carry equates to a higher penalty to hedge.

In 2023, the annualized carry penalty across various tenors differed up to 2% at times (figure 1), with the lower lines representing larger magnitudes of carry penalty while the higher lines represent smaller magnitudes of carry penalty. The relative differences between tenors are more obvious when stacked in an area chart (figure 2), where the smaller areas represent less carry penalty relative to other tenors. In 2023, the longer end of the curve has been smaller and less variable this year, whereas the shorter end of the curve has been larger and more volatile.

FIGURE 1: ANNUALIZED DAILY FORWARD POINTS - USDCHF

Figure 1 shows the annualized daily forward points of the US dollar versus the Swiss franc in a line chart. The figure illustrates carry penalties across various tenors throughout year 2023. The various tenors range from one week to one year and the y-axis bounds are -3.0% to -5.0%.
